

Drought Relief / Temporary Water Solution

In the face of severe drought, North Water Greenland offers a specialized Drought Relief Solution, providing reliable and continuous responses to acute water shortages until the drought is over or local solutions such as desalination plants are ready for operation. Our flexible shipment sizes, ranging from 30,000 m³ to 150,000 m³, cater to diverse needs, offering clients options to buy water directly from our sources or opt for hassle-free deliveries with a charter vessel.

Sourced from pristine Arctic rivers in Greenland or our licensed location in Florida, US, our water undergoes meticulous transportation in clean bulk tanker vessels, ensuring safety and purity through mobile lab equipment and UV disinfection.

This solution is not just a product; it's a responsive resource for communities in need. Governments, defense organizations, emergency relief agencies, and humanitarian organizations are invited to collaborate with us in creating a more water-secure and sustainable world. Together, we can combat water scarcity and ensure clean, safe water is a right accessible to all, even in the most challenging times.
